

Arcodex Whitepaper

Version 2.0 . Arc Chain Launchpad . Native USDC

Abstract

Arcodex is a memecoin launchpad built on the Arc blockchain, where **USDC is the native asset**

-- both the pricing currency and the gas token. Every token launches on a bonding curve with a fixed **1% trading fee**
split **70% creator . 20% platform . 10% holder dividend pool**

. Swapping existing Arc tokens through Arcodex's fee router costs a flat **1.5% (100% to the platform)**

. Arcodex aggregates tokens launched across all launchpads on Arc into a single discoverable marketplace with built-in swap.

1. Problem

Launching a token today is fragmented: multiple launchpads, inconsistent fee models, unclear creator economics, and no unified view

2. Solution

Arcodex provides:

- One-click token launch with two bonding types (Standard, Early Buy).

Native

3. Bonding Curve

Tokens launch on a linear bonding curve:

```
price = startingPrice * (1 + sold / graduationThreshold)
```

- Price rises linearly as supply is purchased.

At 10

Bonding Types

Type	Description
Standard	Linear curve, open to everyone from block one. Fair launch.
Early Buy	Whitelisted early buyers get first access before public trading.

4. Fee Model

4.1 Launch tokens (bonding curve + pool) -- 1.00% per trade

Every buy and sell on a launch token accrues a **1% fee** in USDC, split three ways:

Party	Share of fee	Effective rate	Goes to
Creator	70%	0.70%	Creator fee wallet, claimable anytime
Platform	20%	0.20%	Arcodex treasury
Holders	10%	0.10%	USDC dividend pool, claimable pro-rata

Holder dividends (fee reflection):

10% of every trade is deposited into a per-token USDC dividend pool. Any holder can claim their pro-rata share based on token balance.

4.2 Swap existing tokens (ArcodexFeeRouter) -- 1.50% per trade

Swapping tokens that already have DEX liquidity on Arc (e.g. RadarDex) through Arcodex's atomic fee router:

Party	Share of fee	Effective rate	Goes to
Platform	100%	1.50%	Arcodex treasury

- Fees accrue on-chain in USDC.

5. Architecture

```
|      Smart Contracts (Arc chain)      |
|  ArcodexBondingCurve . ArcodexPool    |
|  ArcodexFeeRouter   . BondingCurveToken |
+-----+-----+
|
+-----v-----+
|      Arc Chain (native USDC)      |
|  L1 . USDC gas . EVM compatible    |
+-----+-----+
```

6. Token Lifecycle

- Launch -- Creator deploys a token with metadata (name, symbol, description, website, socials).

7. Security

- Non-reentrancy guards on all value-moving functions.

8. Tokenomics

Item	Value
Trading fee (launch tokens)	1.00% fixed
Creator share	70% of launch fee (0.70%)
Platform share	20% of launch fee (0.20%)

Holder dividends	10% of launch fee (0.10%)
Swap fee (existing tokens)	1.50% fixed, 100% platform
Price currency	USDC (native)
Curve graduation	100% of bonding supply

9. Roadmap

-	Phase 1 -- Launchpad live (bonding curves, fees, claim, holder dividends).	-	Phase 2 --

10. Disclaimer

Arcodex is a protocol for launching and trading community tokens. Tokens launched on the platform carry risk, including total loss. N
